## Developing and validating a novel multisource comorbidity score from administrative data: a large population-based cohort study from Italy

Giovanni Corrao,<sup>1,2</sup> Federico Rea,<sup>1,2</sup> Mirko Di Martino,<sup>3</sup> Rossana De Palma,<sup>4</sup> Salvatore Scondotto,<sup>1,5</sup> Danilo Fusco,<sup>3</sup> Adele Lallo,<sup>3</sup> Laura Maria Beatrice Belotti,<sup>4</sup> Mauro Ferrante,<sup>6</sup> Sebastiano Pollina Addario,<sup>1,5</sup> Luca Merlino,<sup>1,7</sup> Giuseppe Mancia,<sup>8</sup> Flavia Carle<sup>1,9</sup>

**Figure 2** Receiver operating characteristic (ROC) curves comparing discriminant power of multisource comorbidity score (MCS), Charlson Comorbidity Index (CCI), Elixhauser Index (EI) and Chronic Disease Score (CDS) in predicting 1-year survival among National Health System (NHS) beneficiaries (internal validation set).

Elderly?  
Multimorbidity?  
Heart Failure patients?  
...

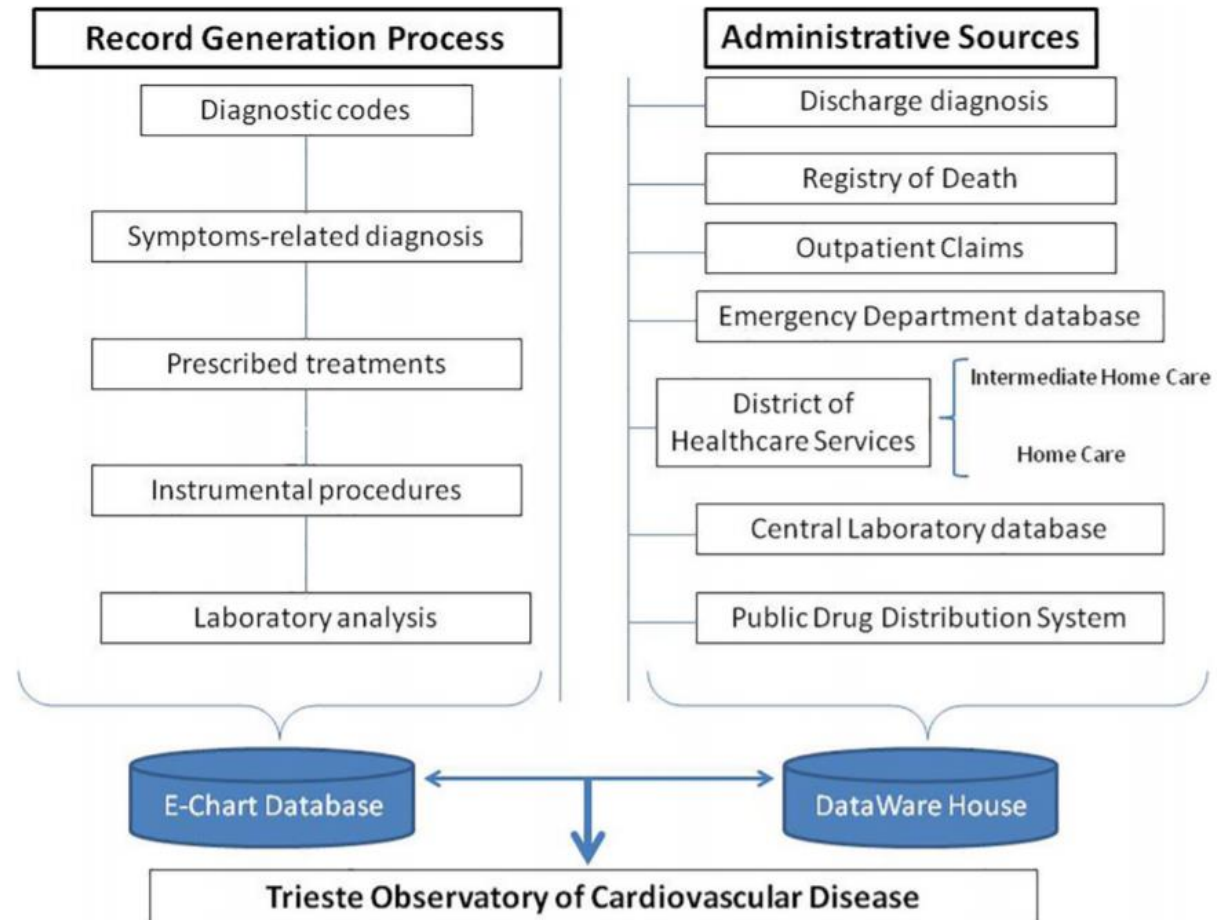

Table 1 Assignment of weights in building the multisource comorbidity score (MCS) through a time-to-death multivariate Weibull model		
Disease/condition	Regression coefficient (SE)	Weight
Metastatic cancer	1.63 (0.04)	18
Alcohol abuse	0.99 (0.16)	11
Cancer, without metastasis	0.91 (0.03)	10
Tuberculosis	0.88 (0.28)	10
Psychoses	0.77 (0.05)	8
Liver disease	0.72 (0.05)	8
Anxiety medication	0.52 (0.23)	6
Weight loss	0.51 (0.12)	6
Dementia	0.51 (0.06)	6
Malignancy medication	0.49 (0.05)	5
Parkinson's disease	0.49 (0.09)	5
Lymphoma	0.46 (0.08)	5
Hemiplegia and hemiparesis	0.46 (0.09)	5
Coagulation defects	0.43 (0.10)	5
Disorders of fluid, electrolyte and acid-base balance	0.40 (0.06)	4
Kidney diseases	0.39 (0.04)	4
Kidney dialysis	0.36 (0.17)	4
Heart failure	0.35 (0.02)	4
Other neurological diseases	0.32 (0.07)	3
Rheumatoid arthritis	0.27 (0.11)	3
Anaemias	0.26 (0.04)	3
Cerebrovascular diseases	0.25 (0.03)	3
Diabetes	0.20 (0.02)	2
Vascular diseases	0.20 (0.05)	2
Gout	0.18 (0.03)	2
Epilepsy	0.18 (0.03)	2
Chronic pulmonary diseases	0.16 (0.02)	2
Peptic ulcer	0.16 (0.02)	2
Acute myocardial infarction	0.11 (0.04)	1
Coronary and peripheral vascular disease	0.11 (0.02)	1
Valvular diseases	0.10 (0.06)	1
Arrhythmia	0.09 (0.02)	1
Obesity	0.08 (0.10)	1
Hypothyroidism	0.07 (0.09)	1

Editorial

# Administrative database, observational research and the Tower of Babel

Annamaria Iorio <sup>a,b</sup>, Gianfranco Sinagra <sup>a</sup>, Andrea Di Lenarda <sup>a,\*</sup>

**Fig. 1.** Trieste Observatory of Cardiovascular Diseases is an example of population-based databases in which administrative data and clinical information are integrated within observational networks.

# Agenda

## (3 examples)

- Lipid profile, treatment and CV risk
- Atrial fibrillation and NOAC treatment
- Heart failure patients, multimorbidity, treatment and outcome

# LDL distribution based on CV risk

(last available LDL disponibile - 2009-2018 in 570.038/845.669 cases:  
67.4% of  $\geq 35$  yo FVG population)

# Statin prescription and (possible) intolerance in Friuli Venezia Giulia region (n=98618)

# Agenda

## (3 examples)

- Lipid profile, treatment and CV risk
- Atrial fibrillation and NOAC treatment
- Heart failure patients, multimorbidity, treatment and outcome

## Non-vitamin K antagonist oral anticoagulation agents in patients with atrial fibrillation: Insights from Italian monitoring registries

Eur Heart J 2020, submitted

In a prospective, observational community registry, 2528 outpatients with HF (median age 76, 58% men) were examined. Of those, 609 had a LVEF < 40%.

*...machine learning approaches are, essentially, black boxes,  
in which you can't really inspect  
"how the algorithm is accomplishing what it is accomplishing"*

- Non linearities (Simple scores vs more complex models)
- Interactions/association
- Number of events/variables
